INTRODUCING

Quillpost

Write, check and publish **LinkedIn posts** from your terminal or your AI agent.

Official LinkedIn API | CLI | MCP server | MIT

Not affiliated with LinkedIn

THE PROBLEM

LinkedIn shows plain text. Only.

WHAT AN AI DRAFT LOOKS LIKE

```
## Big news
**We launched** a thing
- [read more](https://...)
```

WHAT READERS SHOULD SEE

```
We launched a thing.
→ Clear, plain lines
→ Link in the first comment
```

The feed also cuts a post after about **210 characters**, and links in the body can **reduce reach**.

POST STYLES

Seven styles. One clean post.

`announcement`	Launches, releases, milestones
`insight`	An opinion with supporting points
`news`	Recent developments and why they matter
`story`	A short story that ends in a lesson
`howto`	Numbered steps to a result
`listicle`	Tips, tools, mistakes
`question`	A discussion starter

quillpost styles news

CHECKS

Know before you publish.

Blocks real problems

Empty or over 3,000 characters, markdown that would show literally, bad attachments

Warns about reach

Long hooks, links in the body, missing or too many hashtags

Shows the “see more” cut

Exactly what people read before they tap

Converts markdown

`--plain` turns an AI draft into LinkedIn plain text

FOR AI AGENTS

Agents preview. You approve.

1. **Agent builds a preview**
   `quillpost_preview` publishes nothing

2. **You read the exact text**
   Style, visibility, attachments, warnings

3. **You say yes in chat**
   Only then `approved: true` is sent

A standard MCP server with **17 tools**: works with Claude Code, Cursor, VS Code and more.

A guardrail, not a sandbox: it relies on the agent following instructions.

AND MORE

More than text.

Rich posts	Link cards, images with alt text, document carousels
History	See and delete what you published from the terminal
Drafts	Save a post now, publish it later
Schedule	A local queue (LinkedIn has no scheduling API)
Private	Your credentials stay on your machine

Self-serve API only: your own profile, not Pages or analytics

GET STARTED

Up and running in minutes.

```
# needs a free LinkedIn developer app
git clone \
  https://github.com/ApiCartOps/quillpost
npm install && npm link
quillpost setup \
  --client-id=… --client-secret=…
quillpost login
```

github.com/ApiCartOps/quillpost

Open source, MIT licensed. Docs, post styles and the MCP guide are in the repo.
